

# Cloud Managed Solutions

Is enhanced security and network protection important to you?

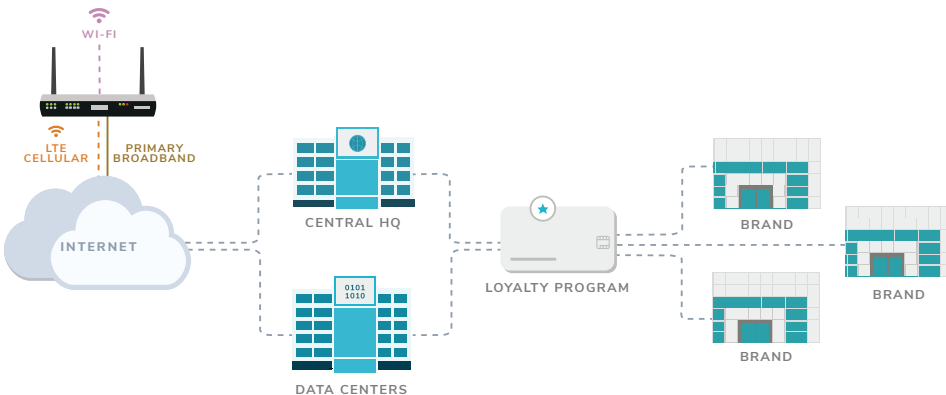

## WHO WE ARE

Mako Networks offers a PCI DSS-certified network creation and management platform specifically designed for distributed enterprise environments like those found in the restaurant industry. Mako utilizes our proprietary SD-WAN technology (called VPN Cloud) to encrypt traffic and allow secure transport over any broadband connection (including cellular) to and from your remote locations.

Mako technology has been chosen by three of the top 12 Fortune 500 companies to reduce audit scope, simplify network creation and management, and increase security. Typically, Mako enterprise customers tie hundreds or thousands of remote locations to head office data centers, third-party payment processors, remote software vendors, remote users or designated auditors using standard internet connections and built-in LTE failover.

**Do you need secure data transfer, bandwidth flexibility or POS traffic segmentation between multiple locations?**

“A key feature of the Mako System that stood out as we were choosing the best fit for the Cicis network is the ability to implement the shared PCI-compliance template on Wi-Fi connections,” said Cicis Network Security Engineer John Tilton. “This is a critical requirement for Cicis as we transition to new wireless tablets for all point of sale devices.”

**John Tilton, Cicis**

## WHAT WE DO

Mako Networks' combination of network edge appliances and secure hosted cloud management delivers a superior network creation and management system for the distributed enterprise. The Mako System makes it simple to create and manage both remote small sites and their WANs connecting them in a resilient and scalable manner to wherever they need to securely exchange information.

In addition to SD-WAN connectivity, the Mako System delivers a complete feature set to remote loactions including wifi, content filtering, remote access, reporting, firewalling and QoS.

## HOW WE DO IT

The PCI DSS v3.2-certified Mako System consists of a range of internet-connected network appliances that are 100% cloud managed. The closed-loop management enables enforcement of desired configuration, enterprise-wide templates and central management of thousands of locations from one pane of glass.

While Mako's PCI DSS certification is unique, we also provide secure network management and creation features such as SD-WAN, advanced VPNs, Wi-Fi, cellular backup, content filtering and physical network segmentation. Please contact us to learn more about our technology and to set up a product demonstration.
